

Final AI Handoff Documentation

Source Code + Database Dump + Source-to-Dump Mapping Review

Field	Value
Document Version	v2.1 English
Status	Final AI Handoff Baseline
Prepared For	AI Delivery Team / Engineering Team / Project Owner
Prepared By	Lizaa, AI Project Secretary and Documentation Lead
Evidence Basis	01 ACCOUNT.zip, 02 OTHER.zip, iTEST02_2026-06-14_14-41-19.dump, generated mapping inventories
Closure Baseline	Phase B 100% Evidence Gate Baseline v1.5

1. Executive Summary

This document is the final English handoff package for project SMEPLUS-26-06-29-001. It summarizes the learning baseline created from the uploaded Odoo source code archives, the PostgreSQL database dump, and the generated source-to-dump mapping evidence. The purpose is to allow downstream AI agents and project team members to continue documentation, development, validation, and automation work using traceable evidence rather than assumptions.

The baseline does not represent permanent training of an AI model. Instead, it is an evidence-driven project knowledge base that can be attached, indexed, loaded into a retrieval workflow, or used as controlled context by other AI systems.

2. Project Scope

Area	Included	Primary Evidence
Source Code Discovery	Yes	01 ACCOUNT.zip and 02 OTHER.zip
Database Dump Discovery	Yes	iTEST02 PostgreSQL custom dump
Model-to-Table Mapping	Yes	Generated mapping inventories
Field-Level Mapping	Yes, baseline level	ORM and dump column inventories
Foreign Key Review	Yes	Constraint and FK edge inventories
Security Review	Yes, baseline level	Access and security inventory
UI / XML Review	Yes, baseline level	XML view/action/menu inventory
Business Rule Discovery	Yes, method inventory level	Business rule and method inventory
Evidence Gate Closure	Yes	Phase B Closure Pack v1.5

3. Baseline Evidence Summary

Evidence ID	Evidence Name	Purpose	Status
EV-0001	01 ACCOUNT.zip	Accounting module source code baseline	Accepted
EV-0002	02 OTHER.zip	Additional Odoo source code modules	Accepted
EV-0003	iTEST02 dump	PostgreSQL database dump baseline	Accepted
EV-0004	Mapping CSV inventories	Generated source-to-dump mapping evidence	Accepted
EV-0005	Phase B Closure Pack v1.5	Evidence gate closure baseline	Accepted

4. Quantitative Baseline

Metric	Value	Meaning
Database Tables	1,395	Tables extracted from the database dump baseline
Database Columns	13,940	Column inventory extracted from dump evidence
Database Constraints	6,682	Constraints extracted from dump evidence
Foreign Keys	5,141	Relationship edges extracted for ER and lineage analysis
Indexes	1,714	Index inventory for performance and technical review
Field-Level Mappings	27,682	Source/ORM-to-database field baseline records
XML/UI Records	6,260	Views, actions, menus, and UI metadata baseline
Security Records	473	Access rights and security baseline records
Business Rule / Method Records	4,377	Detected methods for business rule analysis

5. Learning Baseline for AI Team

The AI team can use this baseline in four practical ways:

- As retrieval context for answering questions about the Odoo implementation.
- As a structured source of truth for generating module-level documentation.
- As mapping evidence for source-to-database validation and impact analysis.
- As a controlled evidence gate for future development, migration, QA, and governance work.

6. Recommended AI Operating Rules

- Do not claim a module, field, table, or business rule exists unless it is present in the evidence pack.
- When a conclusion depends on source code, cite the related module, file, class, method, or CSV row.
- When a conclusion depends on the database, cite the table, column, constraint, index, or foreign key inventory.
- Separate confirmed evidence from inferred behavior.
- Mark missing or ambiguous information as a follow-up evidence request, not as a completed finding.
- Maintain document versioning and evidence identifiers in every generated deliverable.

7. Recommended Folder Structure for Team Continuation

Folder	Purpose
01_Project_Charter	Project constitution and governance baseline
02_Project_Management	Registers, issue log, evidence gate, and progress controls
03_Source_Code	Module inventory, ORM model discovery, field extraction
04_Database	Dump table, column, constraint, FK, and index inventories
05_Mapping	Model-to-table and field-level mapping outputs
06_Architecture	System architecture and module relationship documentation
07_Functional	Functional process documentation and business flows
08_Technical	Technical design, methods, security, and implementation details
09_Diagrams	Flowcharts, ER diagrams, sequence diagrams, and mindmaps
10_Testing	Testing strategy, validation plan, and QA evidence
11_Executive_Report	Management summary and decision support
12_Knowledge_Base	Reusable AI and human-readable knowledge base files
13_Revision_History	Version history and change control
14_Final_Delivery	Final reports, closure checklist, and handoff package

8. Next Workstreams for AI Delivery Team

Workstream	Objective	Expected Output
Module Documentation	Generate detailed documentation for each Odoo module	FSD/TSD per module
Field Validation	Validate ORM fields against database columns	Field-level mapping validation report
Business Rule Analysis	Read methods and map rules to processes	Business rule catalog
Security Review	Analyze access, groups, record rules, and menus	Security matrix and risk register
ERD Generation	Use FK edges and table inventory to generate diagrams	Domain-level ER diagrams
Testing Design	Convert mapping and rules into test cases	QA test catalog and UAT checklist
Executive Reporting	Summarize scope, risk, and progress	Executive dashboard and status report

9. Evidence Gate Status

Gate	Status	Closure Interpretation
Project Constitution	PASS	Approved and used as operating framework
Source Code Baseline	PASS	Available archives were processed and inventoried
Database Baseline	PASS	Dump was processed into table, column, constraint, index, and FK inventories
Mapping Baseline	PASS	Model/table and field-level mapping baselines were generated
Functional Baseline	PASS WITH CONTROL	UI/XML and method inventories provide the baseline; detailed process documentation should continue per module
Technical Baseline	PASS WITH CONTROL	Technical evidence exists; deeper code walkthrough should continue per module
Final Handoff	PASS	AI handoff documentation and closure pack are ready for team continuation

10. Residual Controls and Caveats

- This package is a project knowledge baseline, not a permanent model training result.
- Some behavior in Odoo is dynamic and may require runtime validation in a restored environment.
- Computed fields, related fields, inherited models, and module installation state should be validated in Odoo when runtime access is available.
- The current baseline is sufficient for AI-assisted documentation, mapping, diagramming, QA planning, and continuation by other teams.

11. Handoff Instruction to Next AI Agent

Start by reading the Project Constitution, Evidence Gate Register, Module Inventory, Dump Table Inventory, Dump Column Inventory, Model-to-Table Mapping, Field-Level Mapping, XML View/Action/Menu Inventory, Security Access Inventory, and Business Rule Method Inventory. Use those files as the authoritative project context. Continue work using evidence-first rules and maintain the folder and document numbering convention.

When producing new documentation, always include: project code, document code, evidence references, version, status, assumptions, unresolved evidence gaps, and next action owner.

12. Final Statement

The project has a closed Phase B evidence baseline suitable for downstream AI team continuation. The next AI team should not restart discovery from zero. They should extend the existing knowledge base, validate runtime behavior where needed, and produce module-level deliverables using the evidence pack as the source of truth.
